

## Rotated-frame shift fields per ROI

Source TSV : notes/predict\_shifts\_cluster.tsv  
Total rows : 618,148  
Subjects : 30  
ROIs : 8

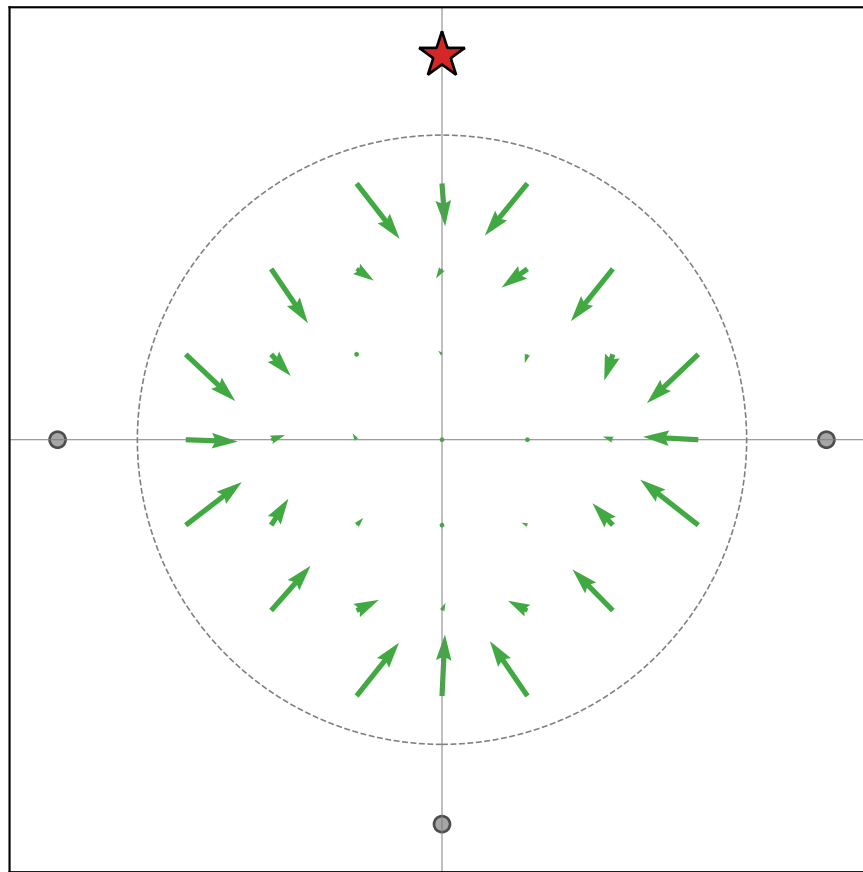

How to read each per-ROI page:

- Every (subject  $\times$  condition  $\times$  voxel) row is rotated so the HP location is moved to canonical (0, +4°). The 4-condition rotational symmetry is collapsed – population pattern with 4 $\times$  more data per bin.
- Voxels are binned into a 9 $\times$ 9 grid covering  $\pm 4.0^\circ$ . Bins with < 20 observations are dropped.
- Three side-by-side panels:
  - PREDICTED – mean predicted shift vector per bin (computed from the joint AF+PRF fit).
  - OBSERVED – mean observed shift vector per bin (from the independent prf\_conditionfit/model4 fits).
  - OBS – PRED – residual after subtracting the model.
- Per-bin aggregation : median
- Arrow scale : auto-fit per ROI so the 85th-pctile arrow occupies ~70% of a bin width.
- Red star = HP location; gray dots = LP locations; dashed circle = bar aperture ( $\sim 3.17^\circ$ ).

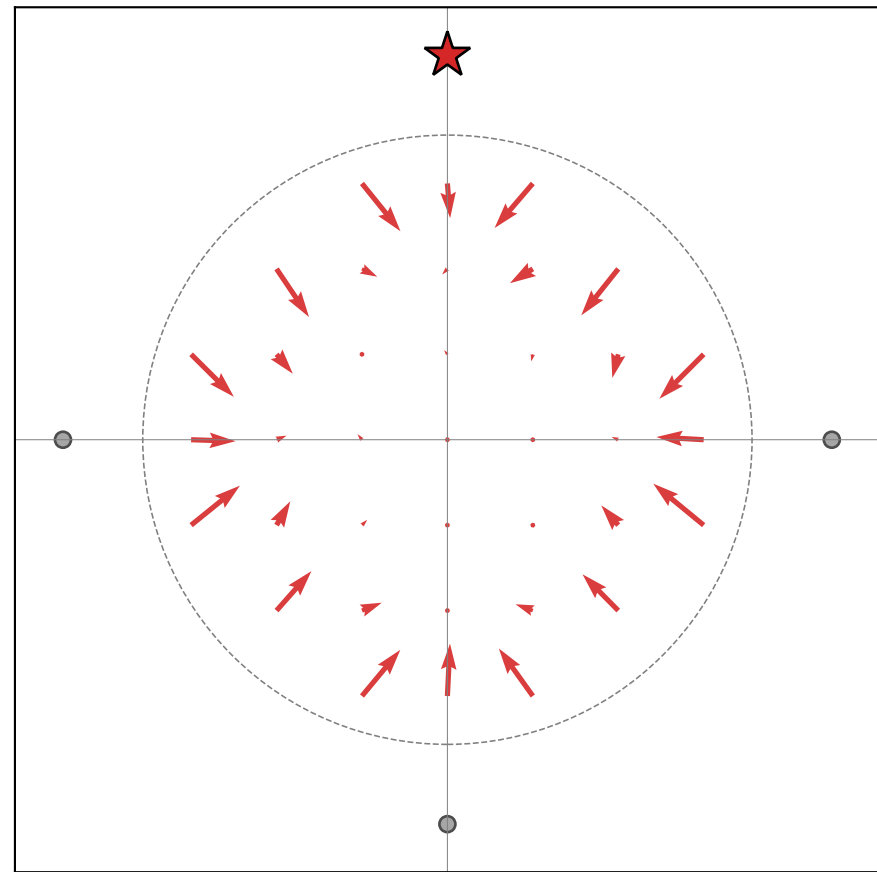

PREDICTED (AF+PRF fit)  $\times 5$

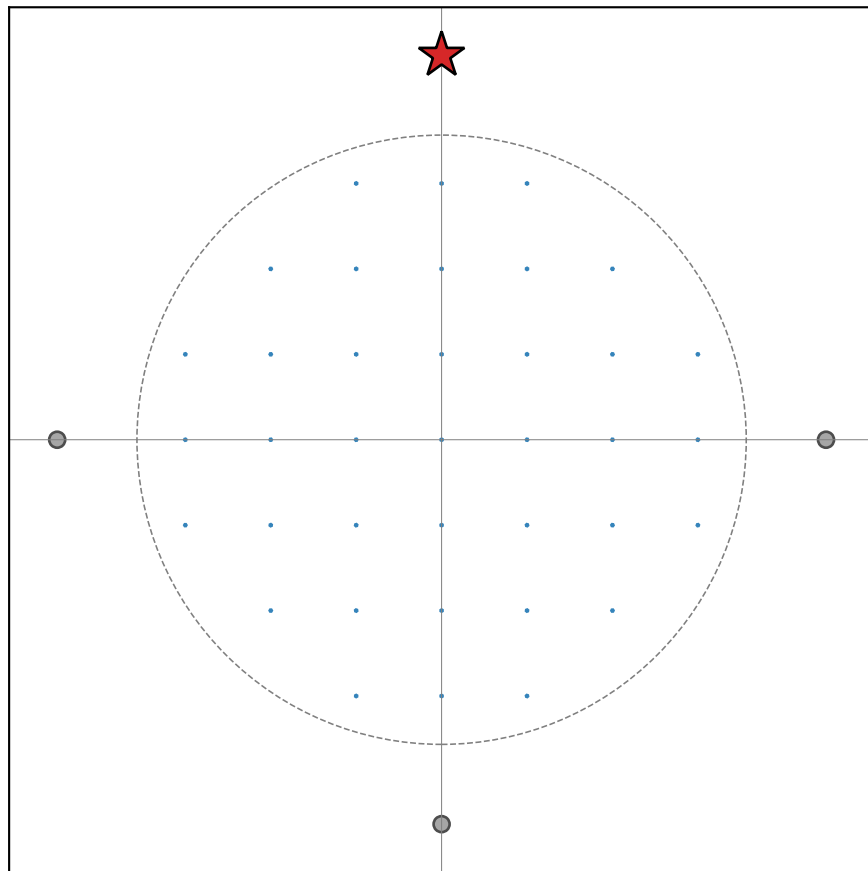

OBSERVED (conditionwise PRF fit)  $\times 5$

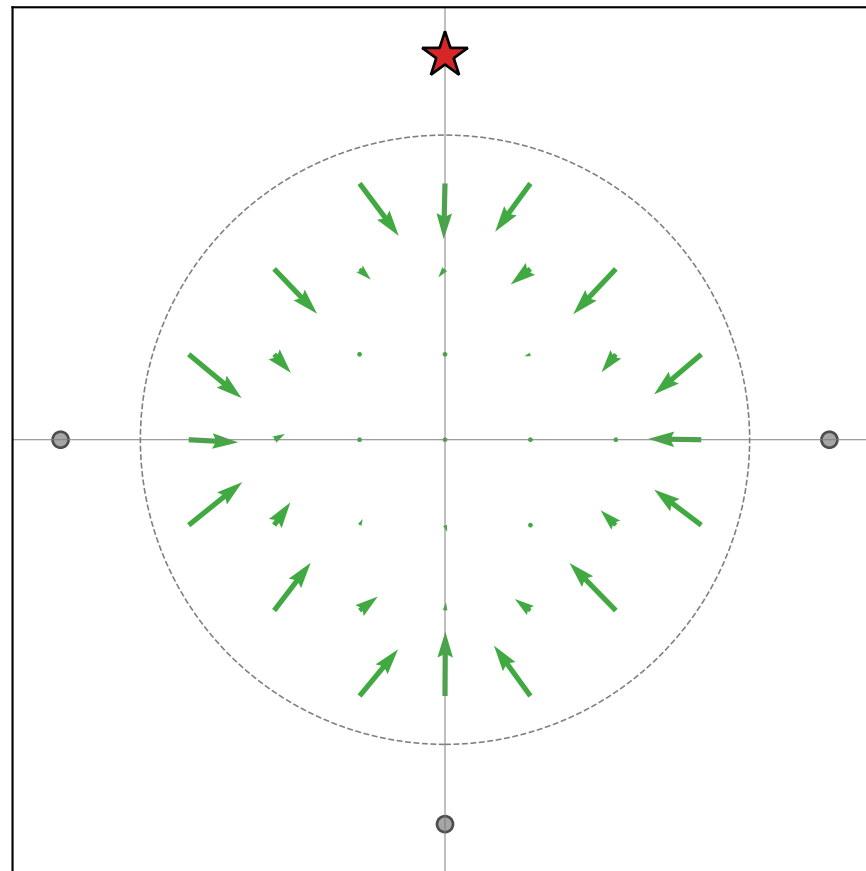

OBS - PRED (residual)  $\times 4$

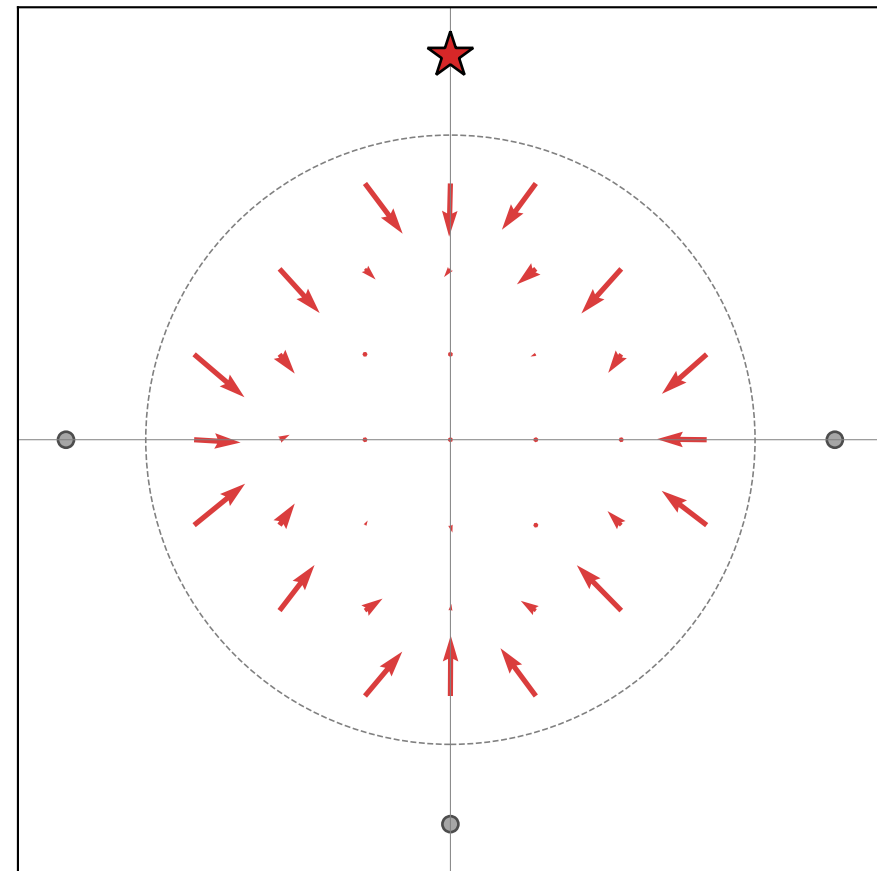

PREDICTED (AF+PRF fit)  $\times 4$

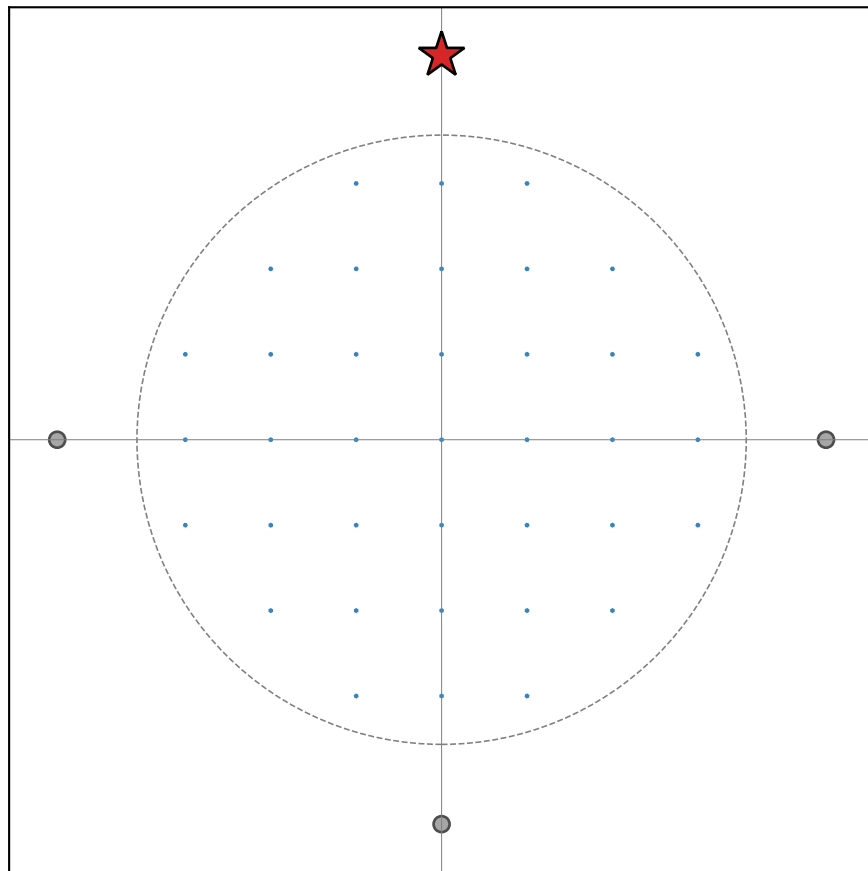

OBSERVED (conditionwise PRF fit)  $\times 4$

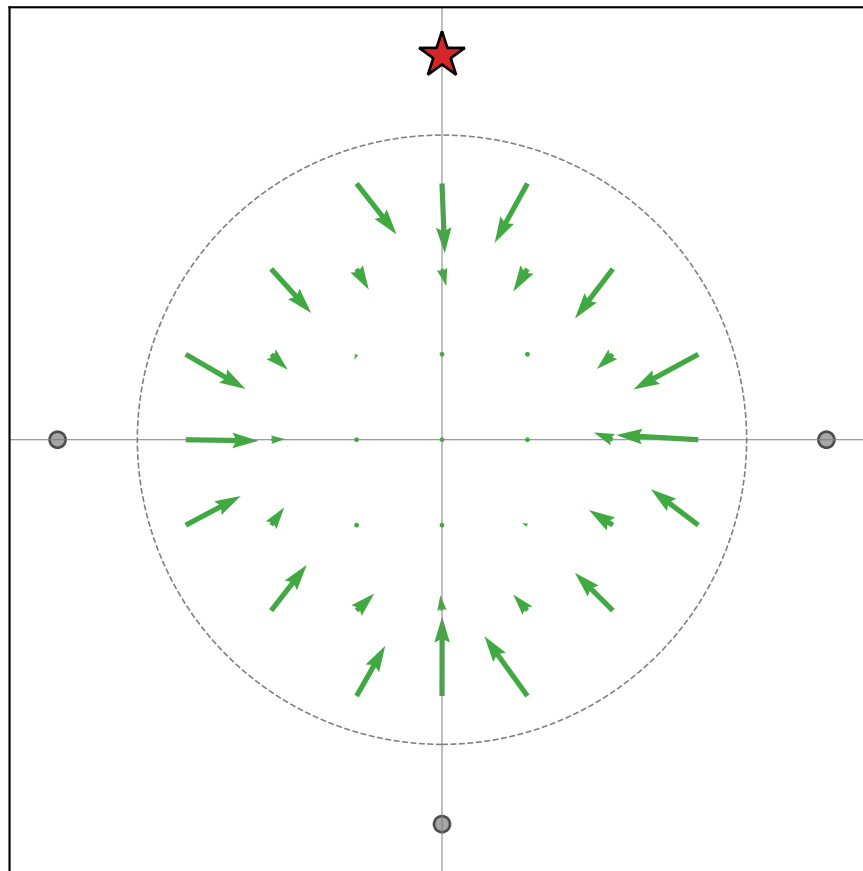

OBS - PRED (residual)  $\times 4$

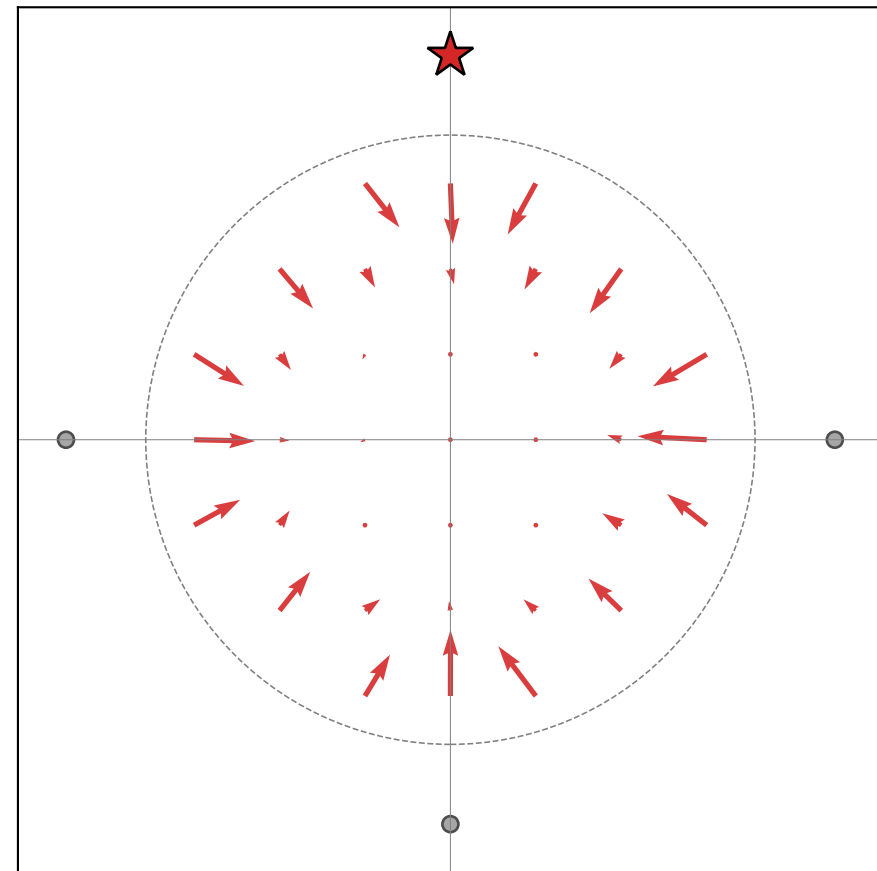

PREDICTED (AF+PRF fit)  $\times 3$

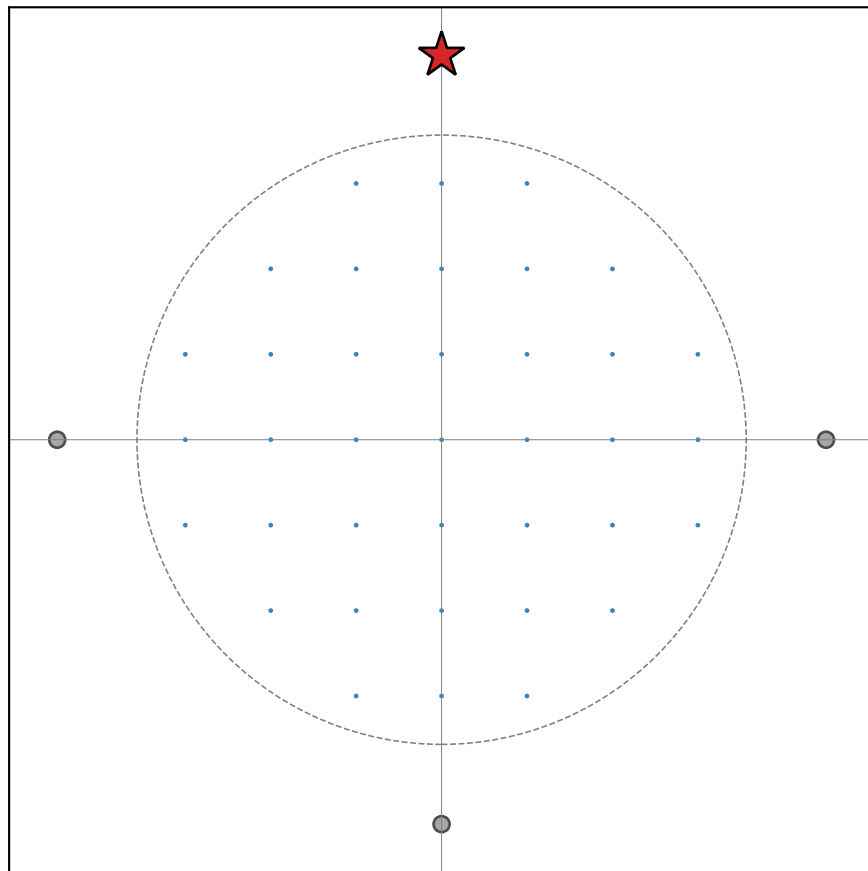

OBSERVED (conditionwise PRF fit)  $\times 3$

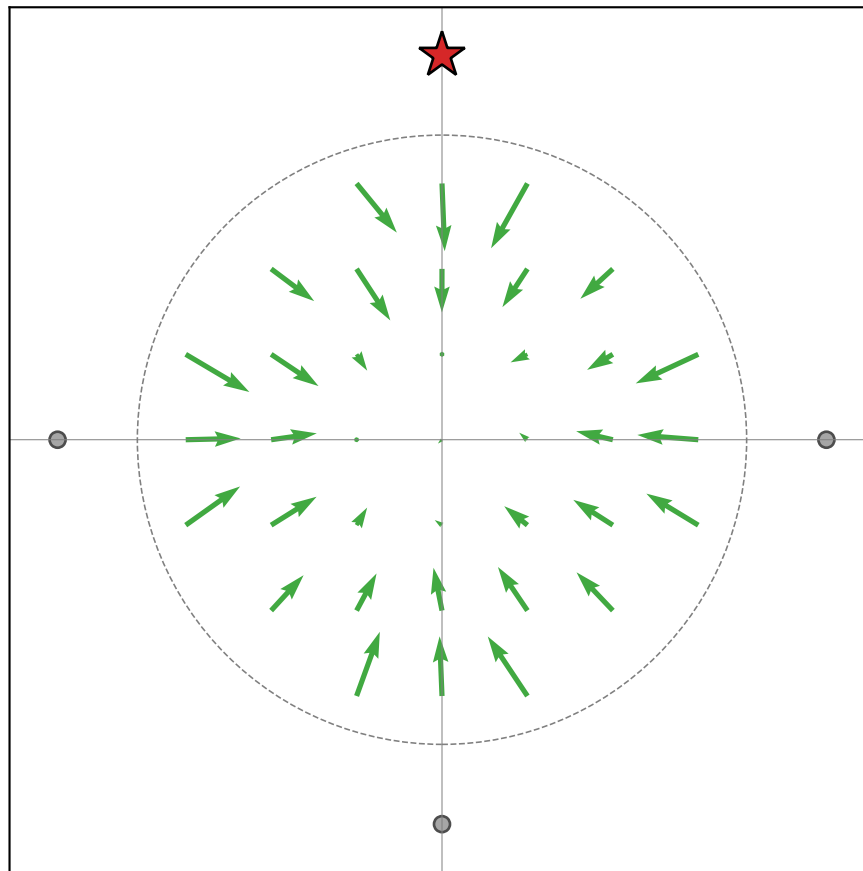

OBS - PRED (residual)  $\times 3$

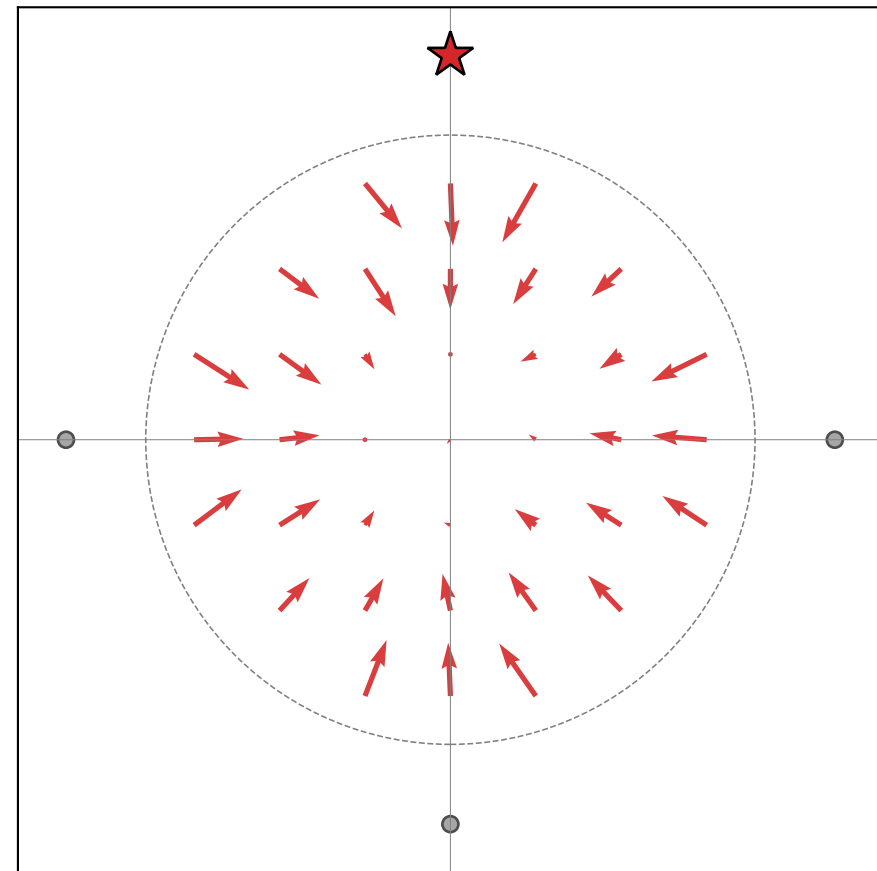

PREDICTED (AF+PRF fit)  $\times 2$

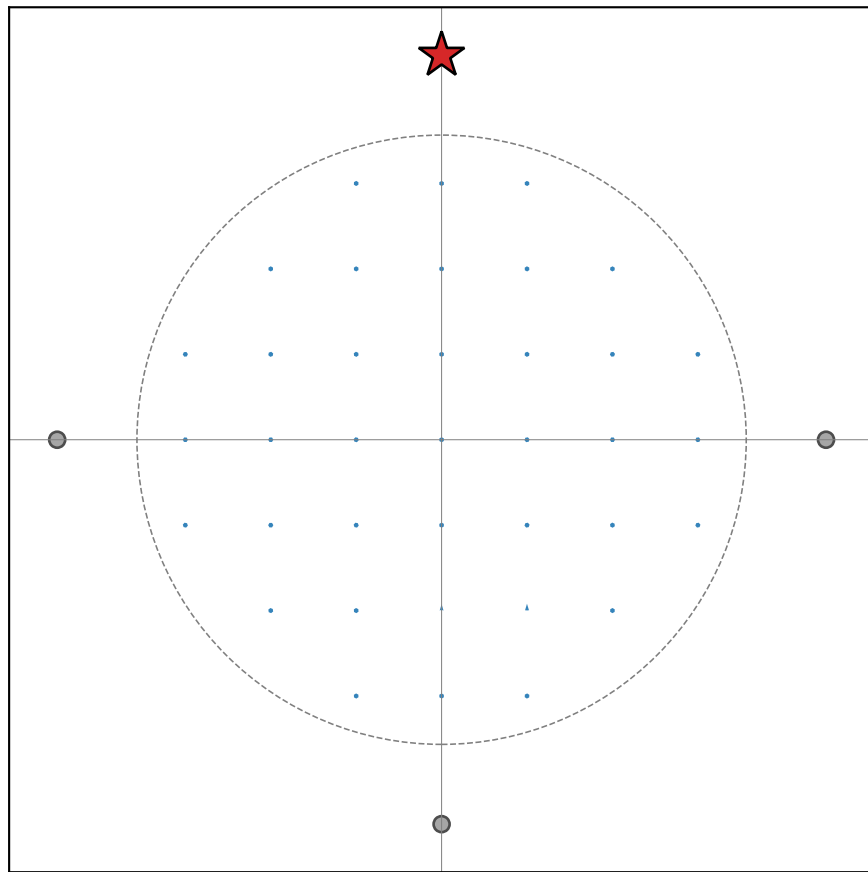

OBSERVED (conditionwise PRF fit)  $\times 2$

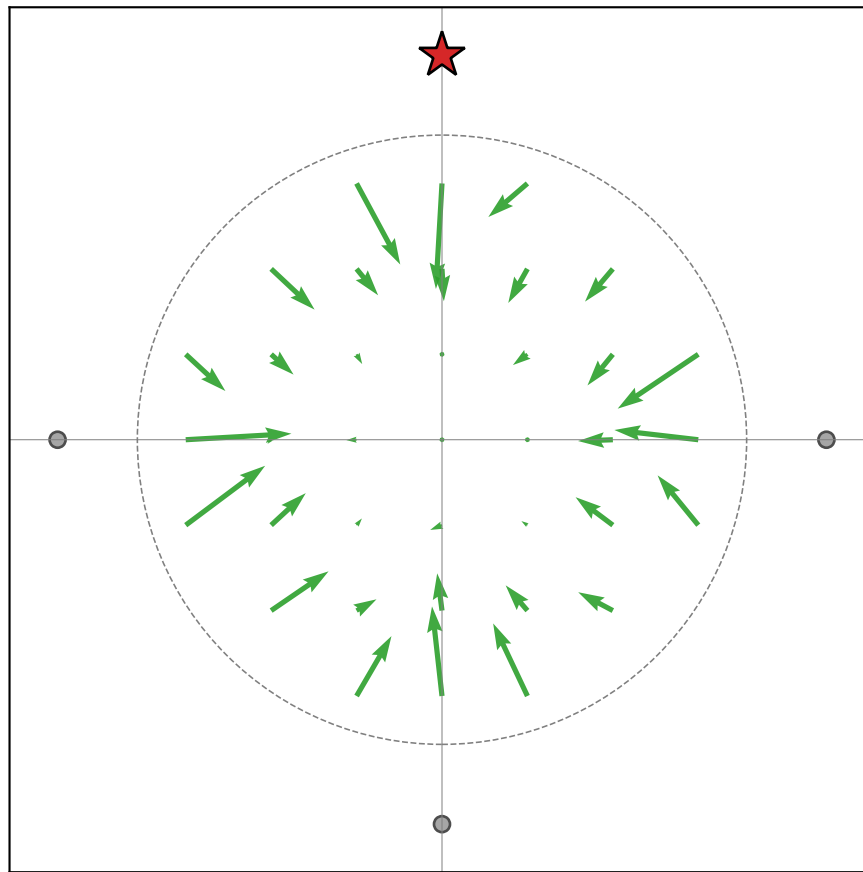

OBS - PRED (residual)  $\times 2$

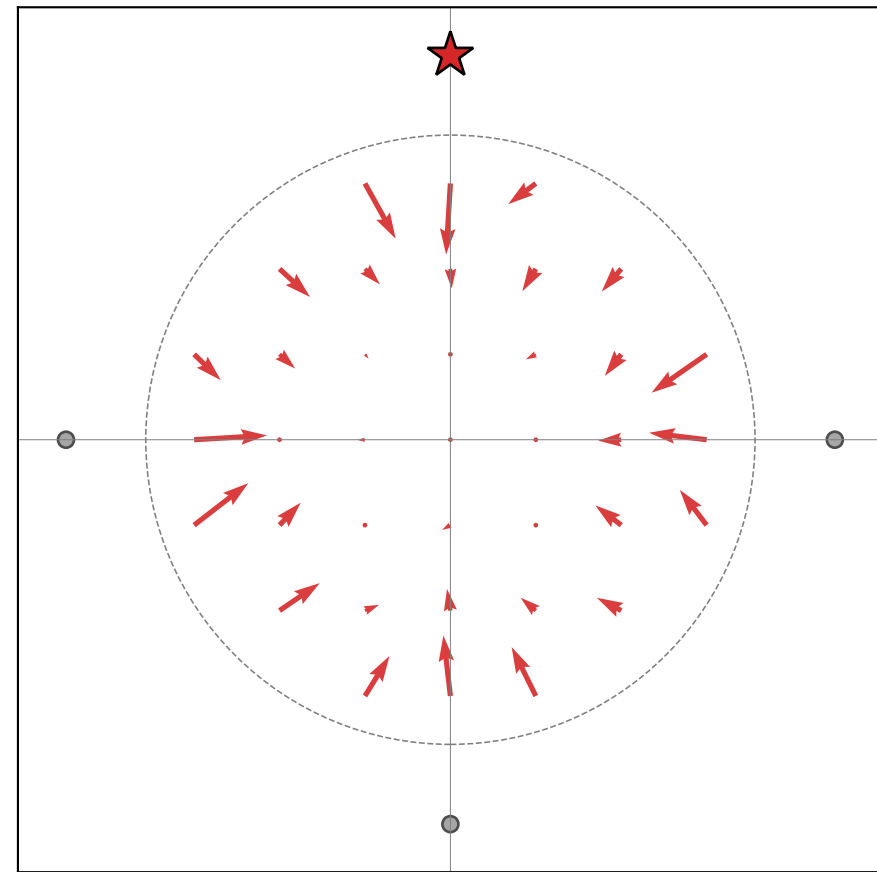

PREDICTED (AF+PRF fit)  $\times 4$

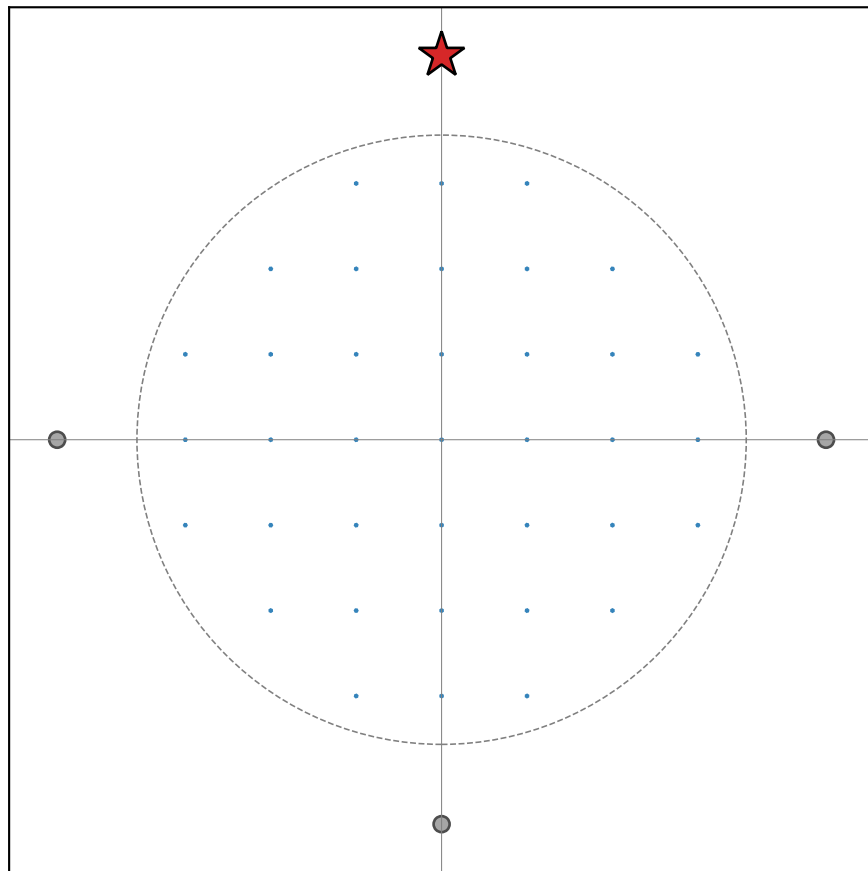

OBSERVED (conditionwise PRF fit)  $\times 4$

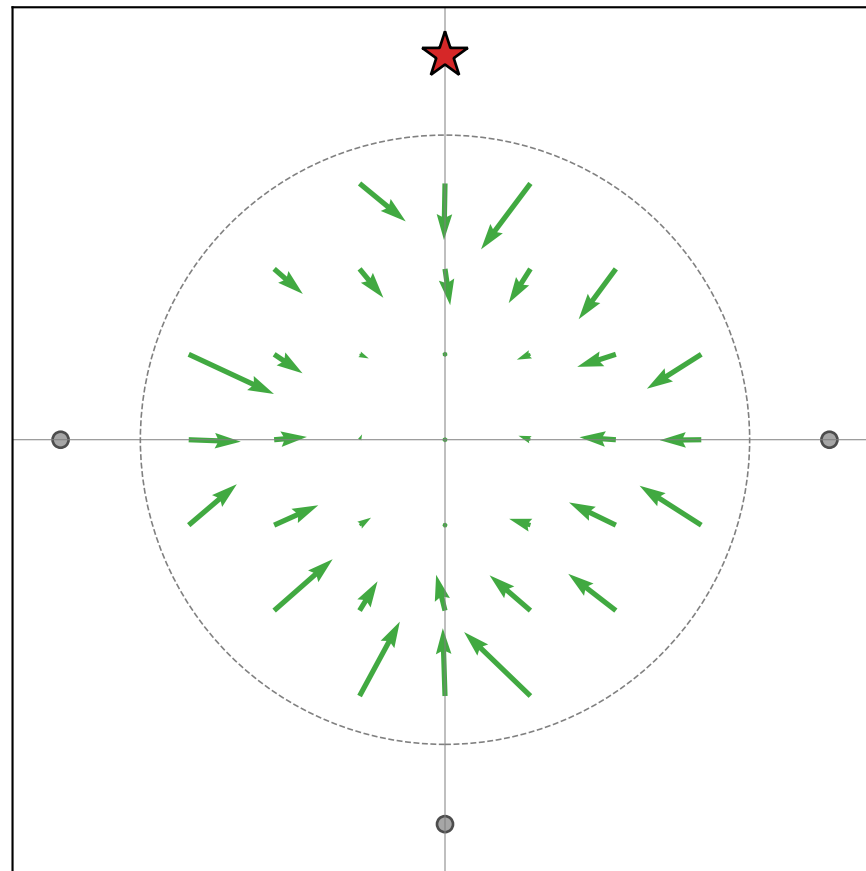

OBS - PRED (residual)  $\times 2$

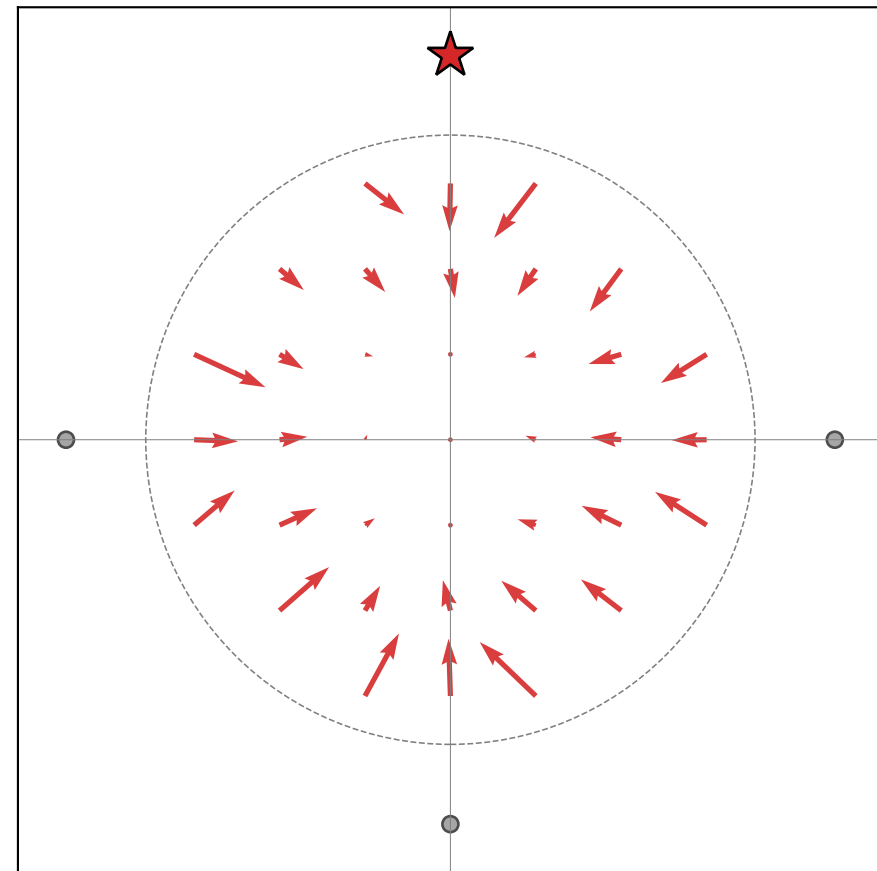

PREDICTED (AF+PRF fit)  $\times 3$

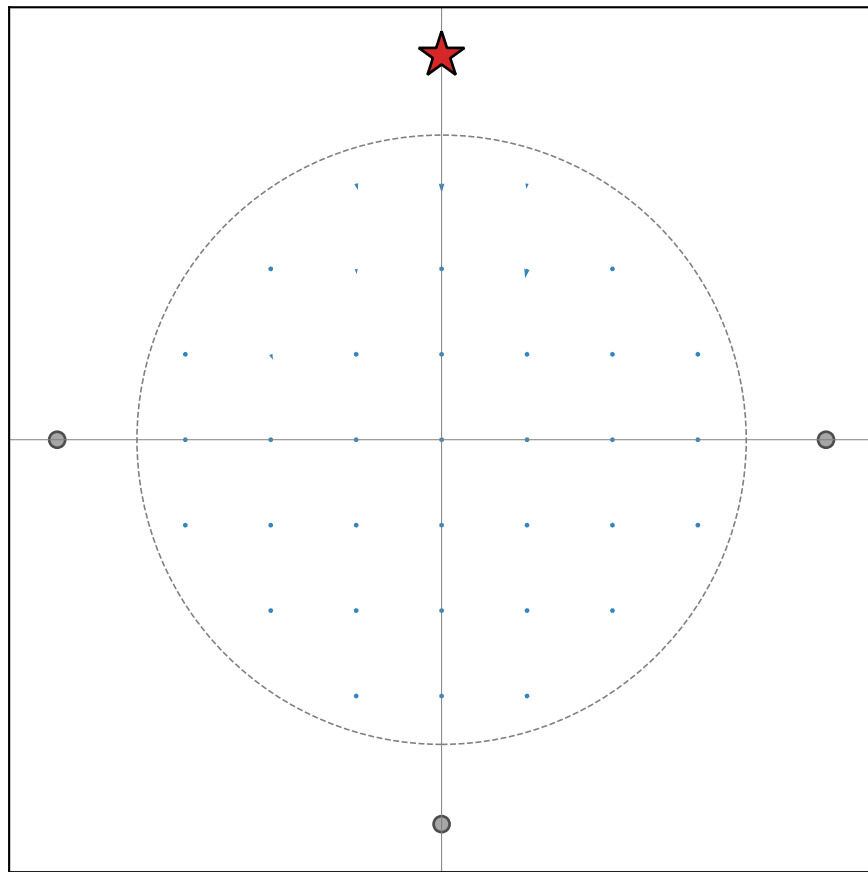

OBSERVED (conditionwise PRF fit)  $\times 3$

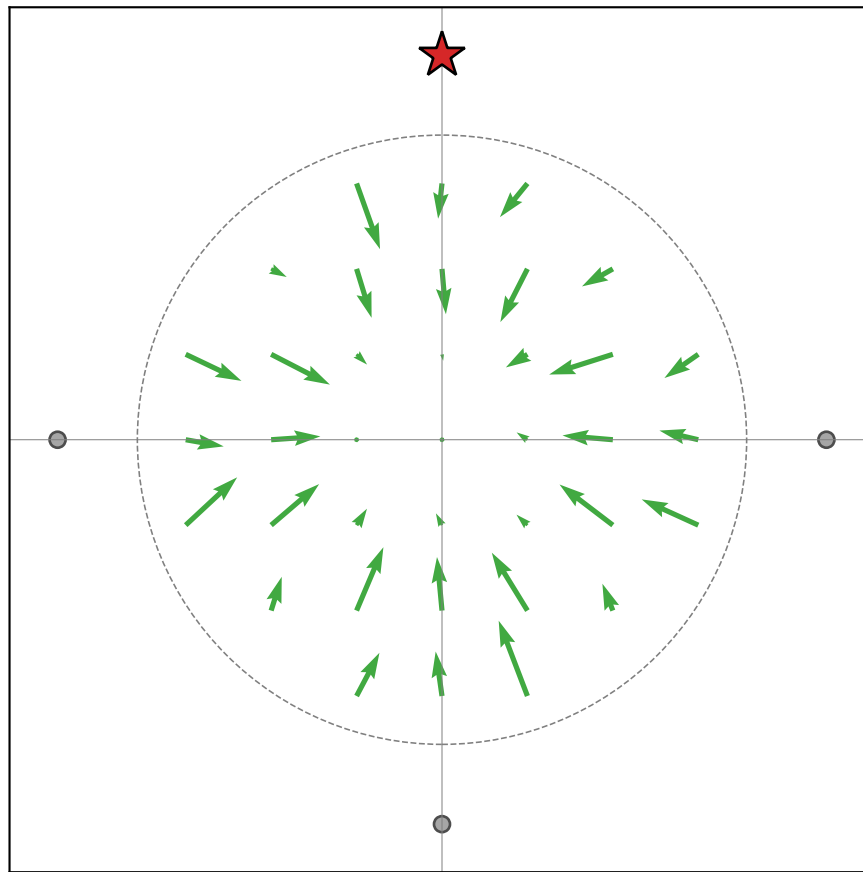

OBS - PRED (residual)  $\times 3$

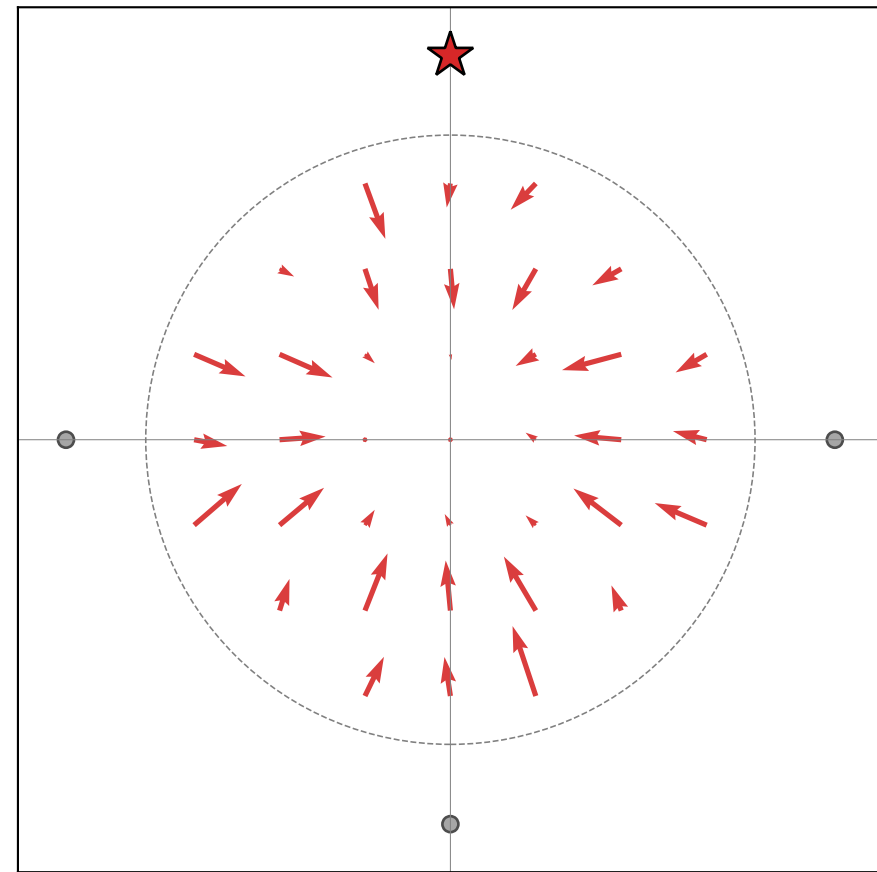

PREDICTED (AF+PRF fit)  $\times 2$

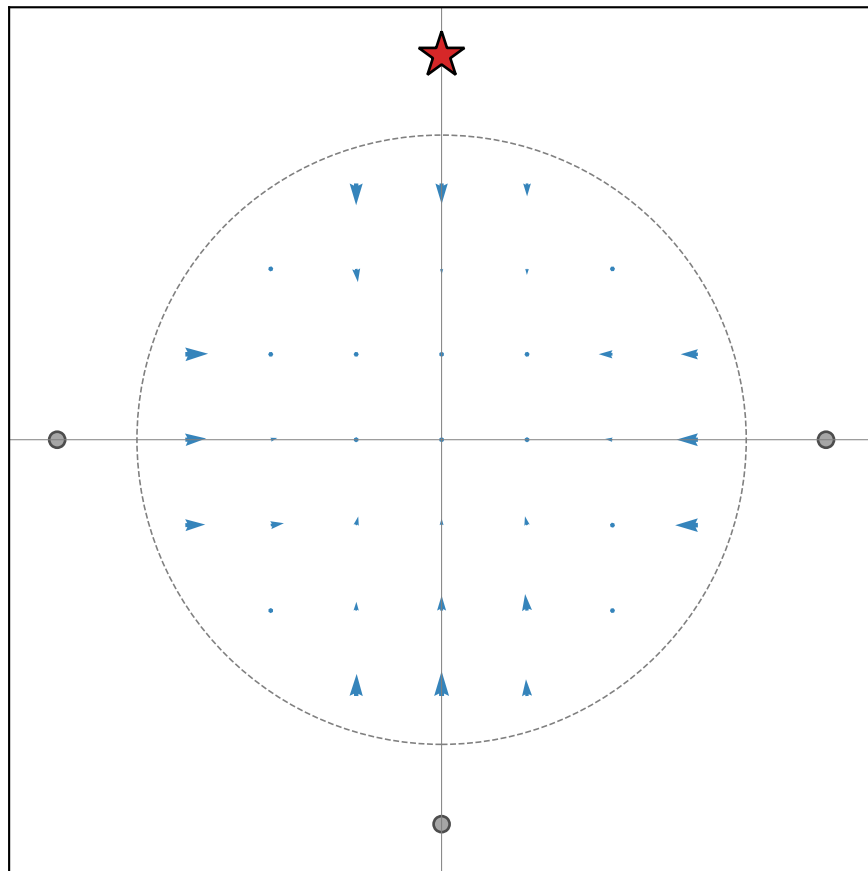

OBSERVED (conditionwise PRF fit)  $\times 2$

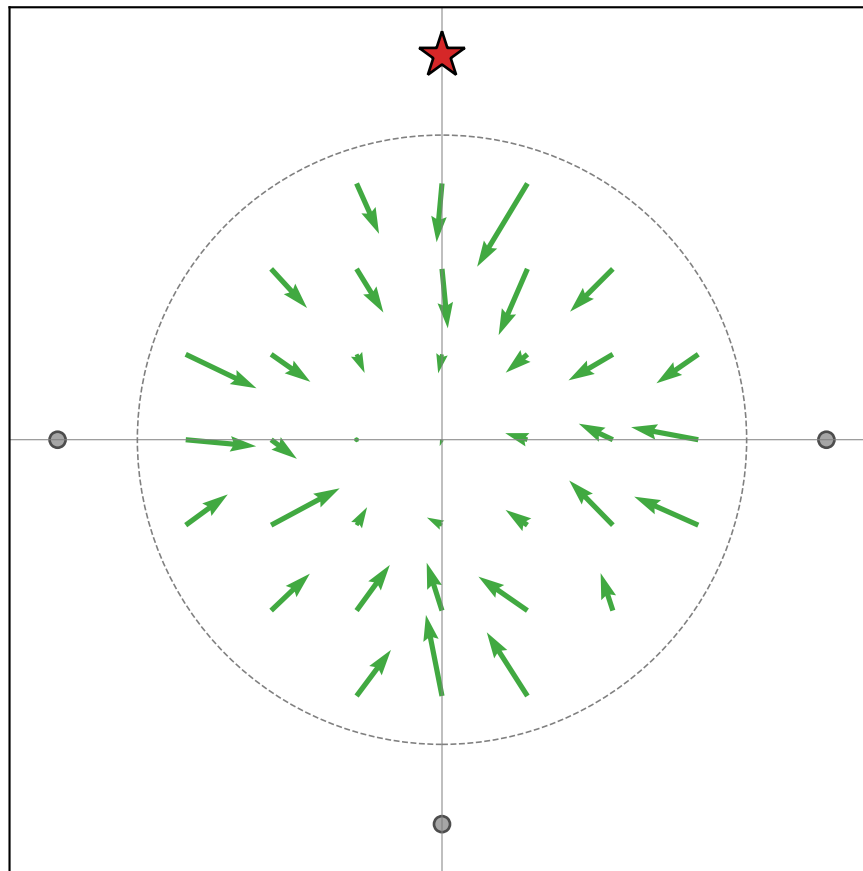

OBS - PRED (residual)  $\times 2$

PREDICTED (AF+PRF fit)  $\times 3$

OBSERVED (conditionwise PRF fit)  $\times 3$

OBS - PRED (residual)  $\times 3$
