

# DoG dyn-v3 + target — PHASIC TARGET-CAPTURE gain (n=30)

$> 0 \Rightarrow$  attentional CAPTURE at target location (the predicted positive control)

DoG dyn-v3 + target — RAW dynamic-distractor gains (survives target expansion?) n=30

g\_HP\_dyn (phasic gain at HP-distractor)

g\_LP\_dyn (phasic gain at LP-distractor)

# DoG dyn-v3 + target — sustained HP-specificity (n=30)

# DoG dyn-v3 + target — dynamic HP-specificity (n=30)

$< 0 \Rightarrow$  HP-distractor suppressed more than LP-distractor (one-sided)

**DoG dyn-v3 + target — RAW sustained gains (green=suppression / red=capture) n=30**

g\_HP (sustained gain at HP location)

g\_LP (sustained gain at LP locations)

# DoG dyn-v3 + target — net phasic distractor effect (n=30)

# DoG dyn-v3 + target — spatial extents n=30

$\sigma_{\text{dyn}}$  (distractor) vs  $\sigma_{\text{T_dyn}}$  (target) per ROI
